DRAKI

Flood warnings for **every paddock**, on any farm, anywhere.

The problem · 28 February 2022 · Lismore, NSW

14.4 m

The river at Lismore, **two metres above** the 1954 record of 12.27 m. Thousands of homes and farms went under.

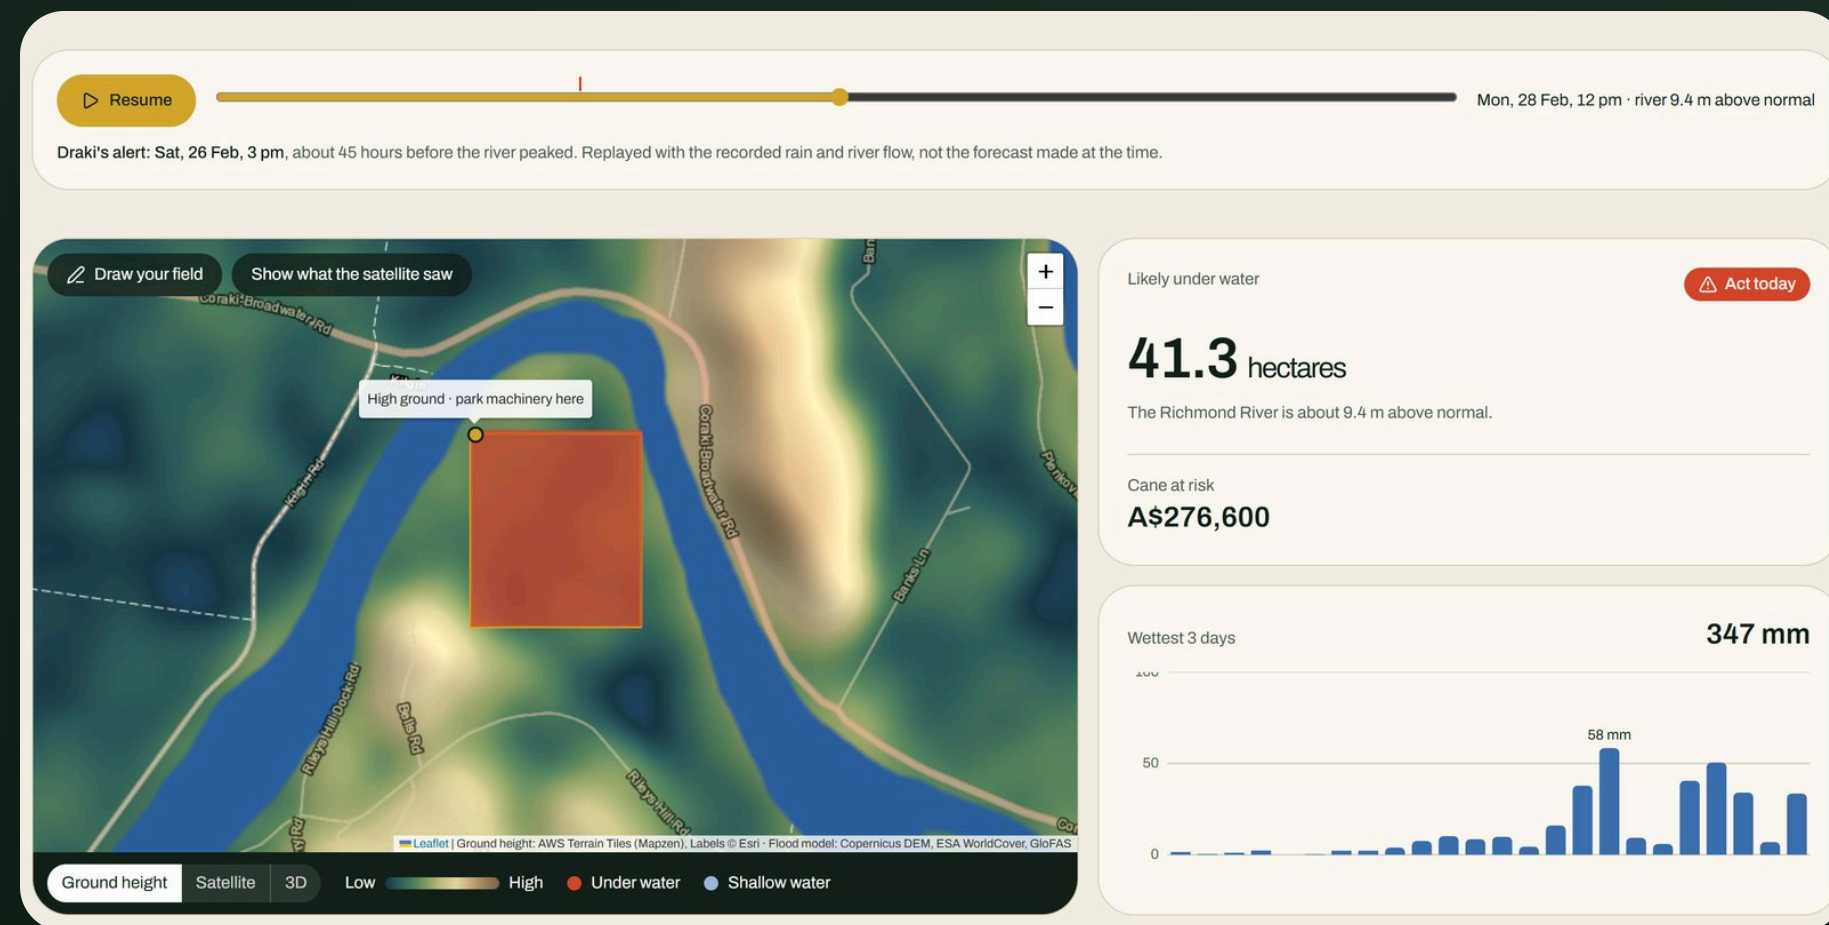

**FLOOD
WARNINGS
COVER
DISTRICTS.
FLOODS HIT
PADDOCKS.**

A valley-wide warning can't tell a farmer that **the bottom of their block goes under first**.

Broadwater sugar mill under ~3 m of water. Northern Rivers cane crush **down 17%**.

Very heavy rain days at Woodburn have **nearly tripled**: 0.9 a year in the 1990s, 2.6 in 2016–25.

What Draki does

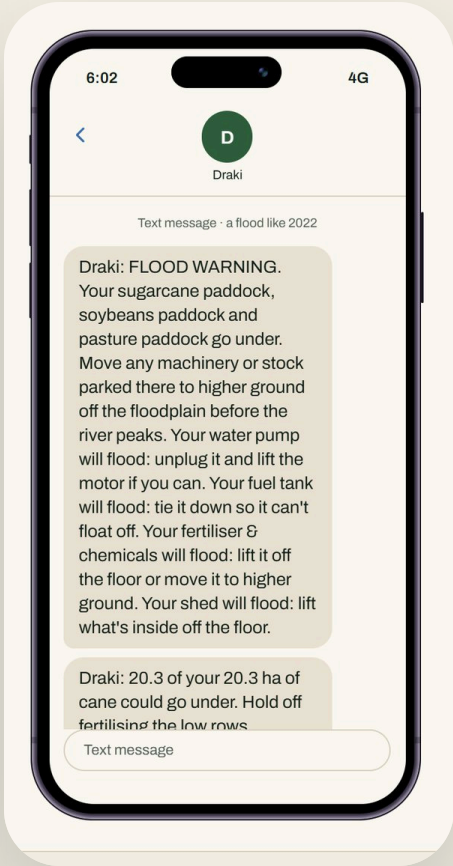

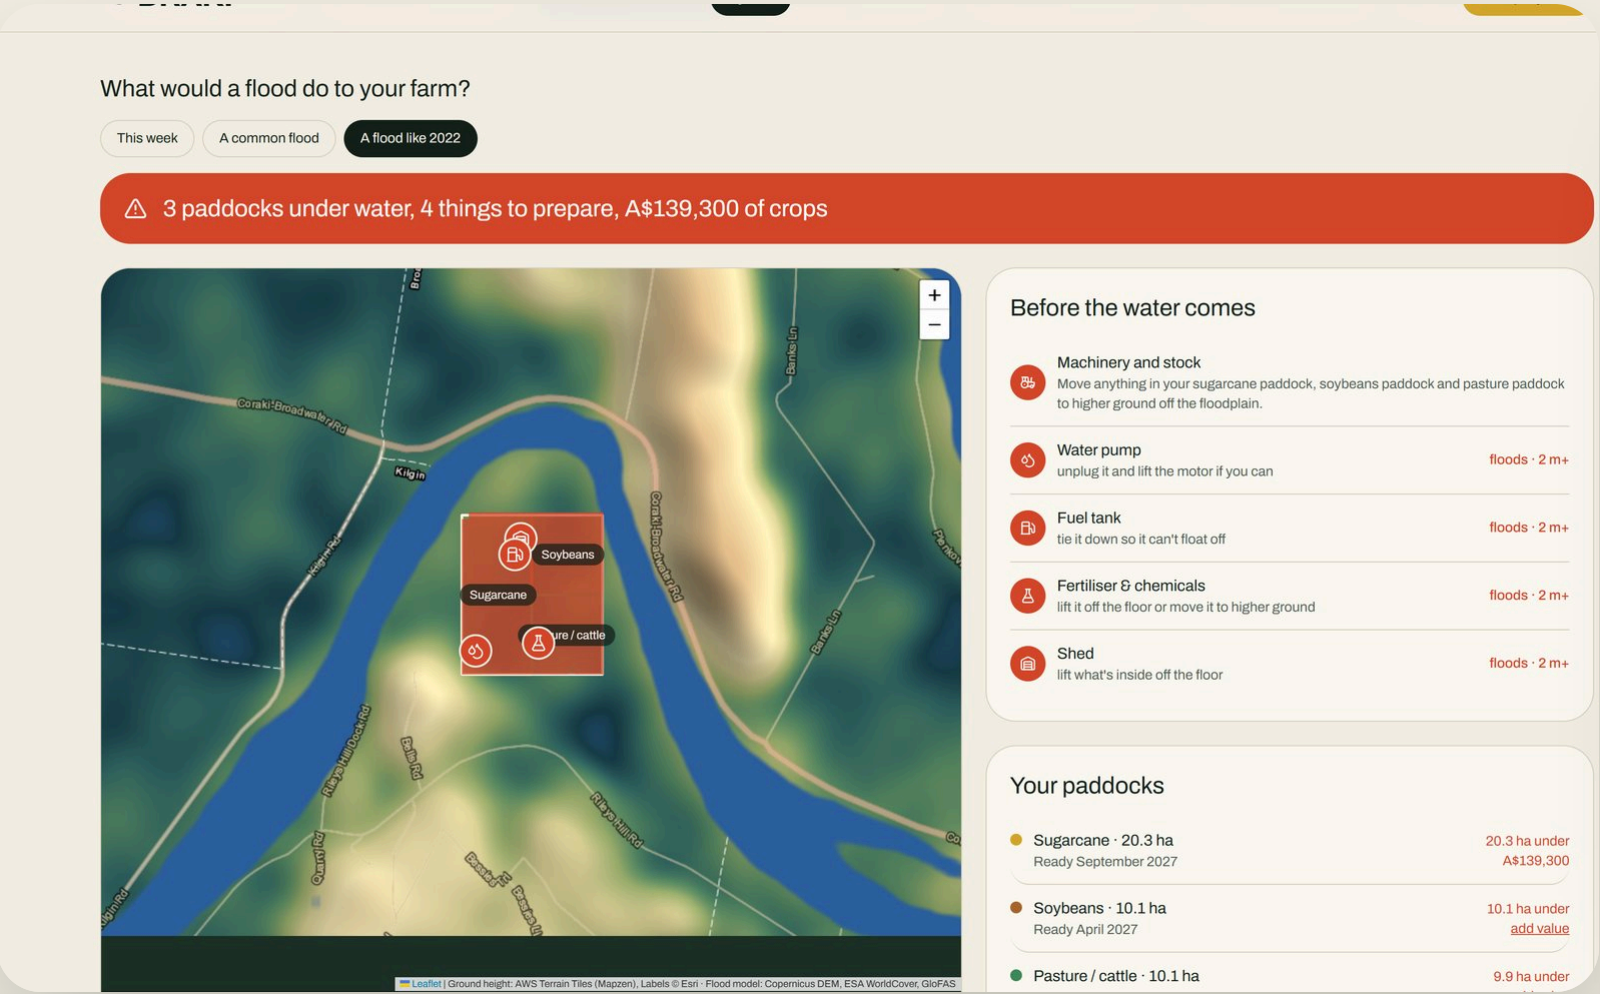

WHICH PART OF THE FARM GOES UNDER FIRST?

Every 30 m square of the farm, checked against Europe's Copernicus river forecast (50 runs) and rain pooling in low spots.

Act today came 45 hours before the 2022 peak, in the hour-by-hour replay.

A text on any phone: what floods, what to move, and one line on why heavy rain is getting more common.

My farm · set up once, by the farmer or a cane adviser

WHAT A FLOOD WOULD DO TO YOUR FARM

This week, a common flood, or another 2022: **which paddocks go under, in ha and A\$.**

Where to move machinery and stock, and **what to tie down** (NSW SES advice, never AI).

Harvest timing, your local climate, fuel vs a solar pump, and a **printable flood record** for grants and insurance.

Does it work?

72%

overlap with the Sentinel-1 radar flood map, 2 March 2022
(critical success index, tuned on this flood)

54%

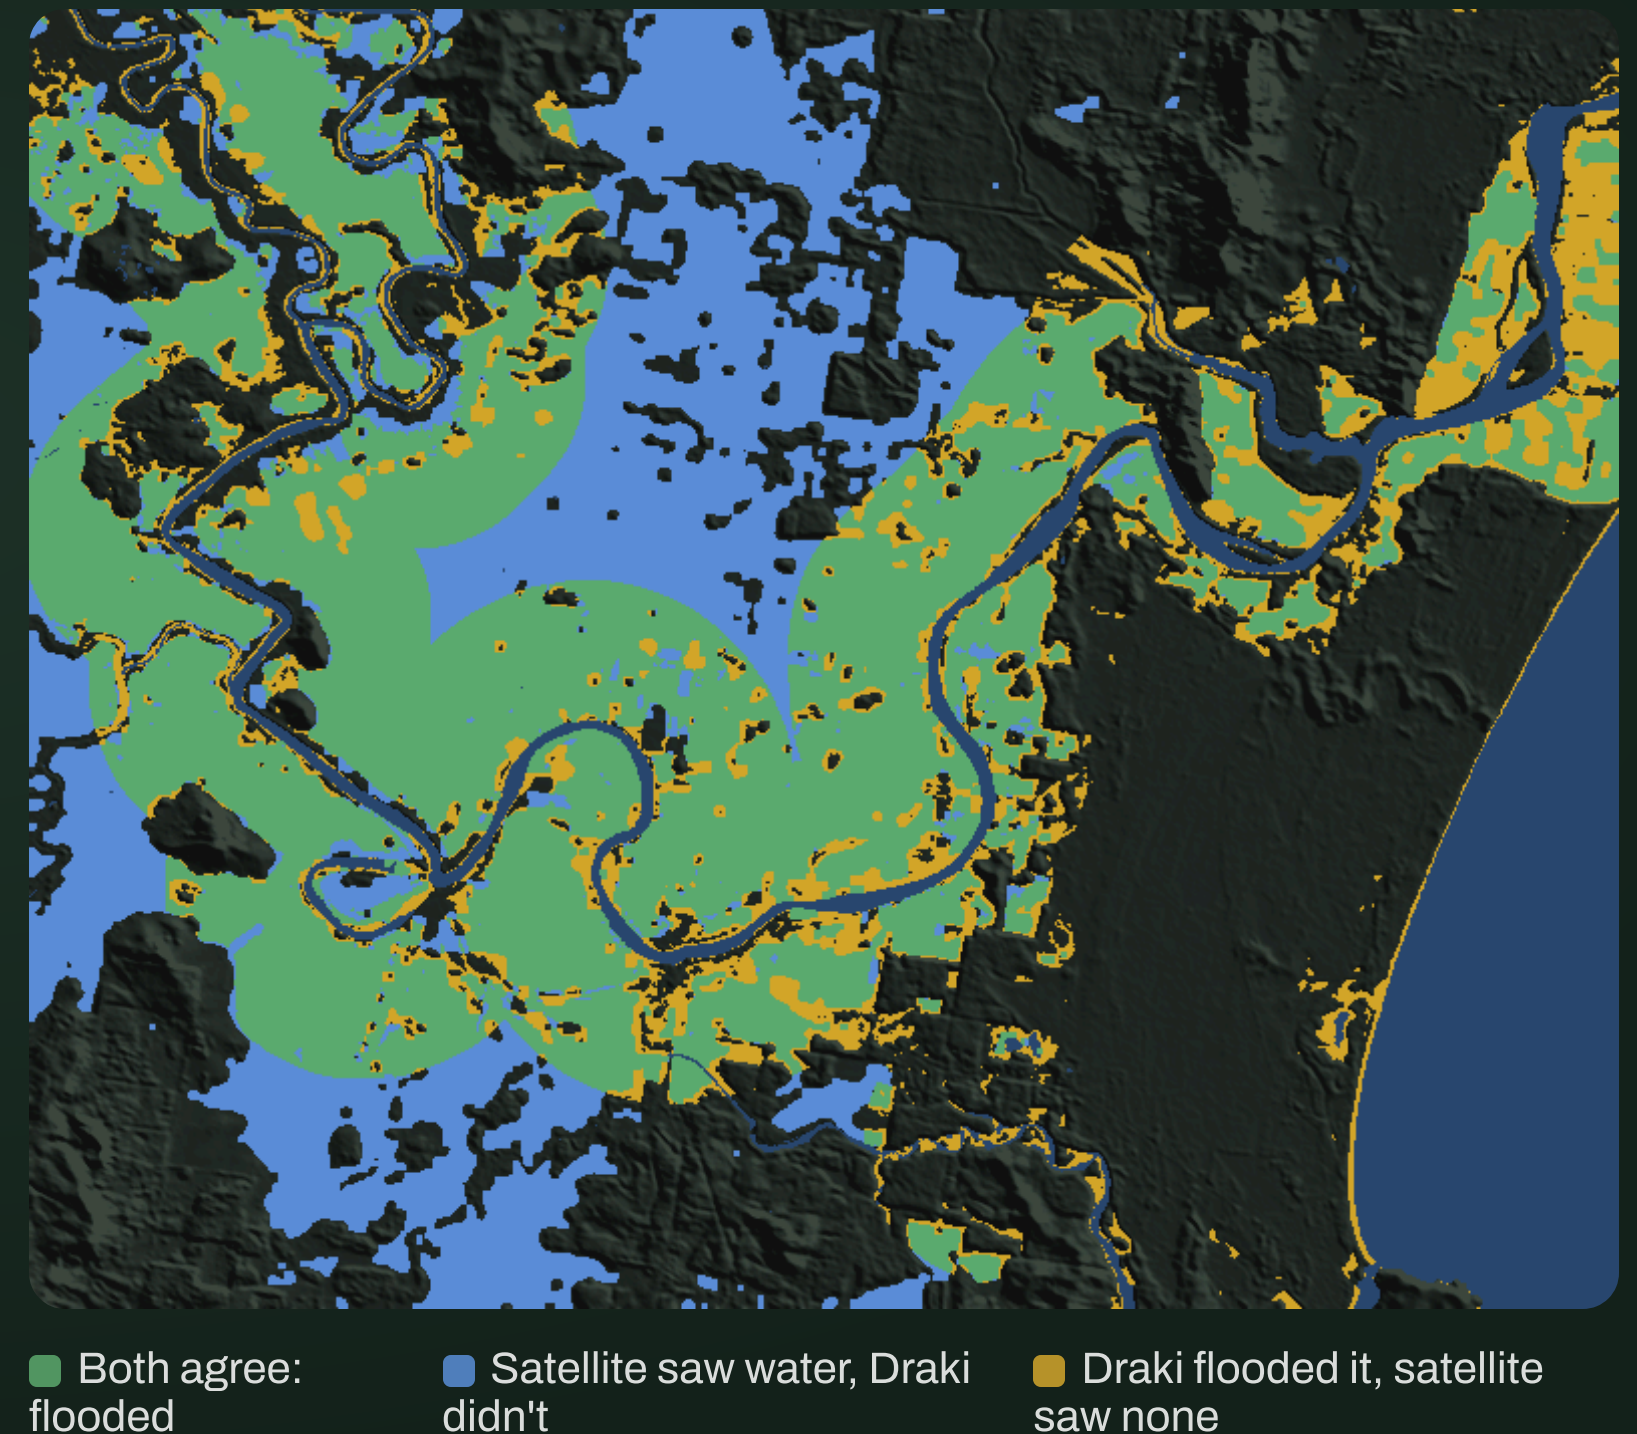

blind test on the second 2022 flood, a radar pass the model never saw. It leans towards warning too much.

6 of 6

recorded floods since 2009 trigger "Act today". Every Act-level peak since 2009 matches a real flood.

45 h

from Draki's first alert to the 2022 river peak (recorded data, replayed hour by hour)

COP31 Climate Awareness & Education

2035 TARGET: CLIMATE EDUCATION FOR ALL, AND CLIMATE-RESILIENT FARMING.

Delivery

COP31 is about delivery. Draki turns the target into actions a farmer takes this week: move the gear, tie down the tank.

Education

Every warning explains why heavy rain keeps getting more common here, where a farmer will actually read it.

Reach

Built only on free EU Copernicus data, so the method runs on any farm, anywhere. Pacific farms next: *Draki* is Fijian for "weather".
